                                                                                                                                                                                                                                                                                                                                                                     Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HOV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/Fill region of HCV subtype 3; (11) the region spanning positions 4664-4730 of the NS3 region of HCV type 3; (11) the region spanning positions 8023-8235 of the NS5 region of HCV type 3; (11) the region spanning positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid Polypeptides encoded by
                                                                                                                                                                                                                                                                                                          0; Gaps
New polynucleotide sequences from hepatitis C virus - and related vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates
                                                                                                                                                                                    the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the NSJ/NS4 region of HCV subtype 3a and is taken from a clone designated

                                                                                                                                                                                Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/F1 region of HCV subtype 3s; (ii) the region spanning positions 4692-5292 of the NS34 region of HCV type 3; (iii) the region spanning positions 8021-8235 of the NS35 region of HCV type 3; (iii) the region spanning positions 8021-8235 of the NS5 region of HCV BR36 subgroup of HCV subtype 3s; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the NS3/NS4 region of HCV subtype 3a and is taken from a clone designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

                                                              Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (i) the region spanning positions 417-957 of the Core/El region of HCV subtype 3s; (ii) the region spanning positions 4892-5292 of the NS3 region of HCV type 3; (iii) the region spanning positions 4892-5292 of the NS3/4 region of HCV type 3; (iv) the region spanning positions 802-8235 of the NS3/6 region of HCV subtype 3s; (iv) the subgroup of HCV subtype 3s; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an
                                                                                                                                                                                                          isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Non-coding region; hepatitis C virus; blood donor; type 2; type 1; HCV; NS-5; phylogeny; differentiation; NS-3; core region; type 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding antigenic peptide(s) of new types of hepatitis C virus - for diagnosing and treating HCV infection, screening blood samples and identifying different HCV types

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                        Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 47-957 of the NS3 region of HCV type 3; (111) the region spanning positions of the NS3 region of HCV type 3; (111) the region spanning positions 802-823 of the NS5 region of HCV type 3; (11) the region spanning positions 802-823 of the NS5 region of the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic region spanning positions 802-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic sisolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the N33/NS4 region of HCV subtype 3a and is taken from a clone designated

The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HVV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HVV genome revealed the existance of three distinct groups of HVV.

Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43088-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type 0 files. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same region between type 3 and type 1 sequences.

C degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 3 and type 1 sequences.

ó
region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the N31 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 3 and type 1 sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       11 TKYIMACMSADLEVTTSTWVLLGGVLAALAAYCLSVGCVVIVGHIELGGKPAIVPDKEVL 70
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existence of three distinct groups of HCV.
Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type I and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 3 and type 1 sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 477-957 of the core/E1 region of HCV subtype 3s; (iil) the region spanning positions 4692-5292 of the NS34 region of HCV type 3; (iil) the region spanning positions 8022-8235 of the NS34 region of HCV type 3; (iv) the region spanning positions 8023-8235 of the NS5 region of HCV subtype 3s; or (v) an HCV subtype 3c genomic region of HCV subtype 3s or (v) an HCV subtype 3c genomic squence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for sercityping. This sequence corresponds to the NS3/NS4 month.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide sequences from hepatitis C virus - and related vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                       Hepatitis C virus; HCV; primer; probe; detection; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                         Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/F1 region of HCV subtype 3s; (1i) the region spanning positions 482-522 of the NS3 region of HCV type 3; (1ii) the region spanning positions 482-522 of the NS3 region of HCV type 3; (iii) the region spanning positions 802-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3s; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation gaainst HCV, for the detection of antibodies directed against HCV and for secretyping. This sequence corresponds to the NS3/NS4
                                                                                                                                                                                                                                                                                                                                                              New polynucleotide sequences from hepatitis C virus - and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HVV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 3 and type 1 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Chan S,

```
The present invention relates to hepatitis C virus (HCV) core antigen and NS (nonstructural) 3/4a antibody combination assay that can detect both HCV antigens and antibodies present in a sample using a single solid matrix as well as immunoassay solid supports for use in the assay. The solid support is useful for detecting HCV infection in a biological sample. The present sequence is MEFA (multiple epitope fusion antigen) in a protein. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hepatitis C virus; HCV; NS3/4a conformational epitope; seroconversion; immunoassay solid support; multiple epitope fusion antigen; MEFA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of this and other regions of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis C virus; NS3/4a antigen; multiple epitope fusion antigen; HCV infection; MEFA 12 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             6

  The present invention relates to a new immunoassay solid support

consisting essentially of at least one hepatitis C virus (HCV) NS3/4a

conformational epitope and a multiple epitope fusion antigen (MEFA),

bound to the support. The NS3/4a conformational epitope and/or

MEFA reacts specifically with anti-HCV antibodies present in a biological

sample from an HCV infected individual. The immunoassay of the invention

is useful for detecting hepatitis C virus infection in a biological

sample. The method of the invention provides a sensitive, accurate

CG dagnostic and prognostic tool to provide adequate patient care and to

prevent transmission of HCV by blood and by blood products, or by

CC prevent transmission of HCV by blood and by blood products, or by

CF sensonal contact. Use of NS3/4a conformational epitope in combination

CC with MEFA, provides a sensitive and reliable method for detecting early

CF serconversion. Use of MEFA has the added advantages of decreasing

CF masking problems, improving sensitivity in detecting antibodies by

CF allowing a greater number of epitopes on a unit surface area of

Substrate, and improving substrate. Detection accuracy is increased and

CF believed the use of highly immunogenic HCV antigens which are present during

CF believed the property of the property of the identification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to immunoassays comprising Hepatitis C Virus (HCV) NS3/4a conformational epitope and multiple epitope fusion antigen (MEFA), bound to a solid support. The NS3/4a epitope and/or the multiple epitope fusion antigen react with anti-HCV antibodies present in a biological sample from an HCV-infected individual. The immunoassays and methods of the invention are useful for detecting support provides a sensitive and reliable method for detecting early HCV seroconversion. The assays can detect HCV infection caused by any six known genotypes of HCV. The use of the multiple epitope fusion proteins decreases masking problems, improves sensitivity in detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunoassay solid support for detecting Hepatitis C Virus infection in
biological samples, comprises Hepatitis C Virus conformational epitope
and multiple epitone fusion apriden

antibodies by allowing a greater number of epitopes on a unit area of substrate, and improves selectivity. The present sequence represents HCV multiple epitope fusion antigen 7.1 (MEPA 7.1), a mutant HCV polyprotein derived from various regions of HCV type 1, 2, or 3 (HCV-1, HCV-2, or HCV-3) polypeptide sequences.

                                                                                   ò
                                                                                                                                                                               Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 477-957 of the Core/Fil region of HCV subtype 3a; (ii) the region spanning positions 4684-4730 of the NS3 region of HCV type 3; (iii) the region spanning positions of HCV type 3; (iii) the region spanning positions 8032-8235 of the NS5 region of HCV type 3; (iv) the region spanning positions 8032-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by capanist HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the NS3/NS4 aregion of HCV subtype 3a and is taken from a clone designated

Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HOV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/El region of HCV subtype 3a; (11) the region spanning positions 4892-5920 of the NS3 region of HCV type 3; (11) the region spanning positions 8023-8235 of the NS5 region of HCV type 3; (11) the region spanning positions 8023-8235 of the NS5 region of HCV subtype 3a; (10) the sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid Polypeptides encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide sequences from hepatitis C virus - and related vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the NSJ/NS4 region of HCV subtype 3a and is taken from a clone designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis C virus; HCV; primer; probe; detection; diagnosis; classification; immunisation; prophylaxis; serotyping; ss.

                                                                                                                   compositions comprising at least 5, and pref. 8 or more contiguous nuclectides selected from an HGV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/F1 region of HCV subtype 3s, (1i) the region spanning positions 4892-5292 of the NS3 region of HCV type 3; (ii) the region spanning positions 892-5292 of the NS3 region of HCV type 3; (ii) the region spanning positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic solate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the NS3/NS4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with

The sequences given in AAQ43106-111 show bases 4911-5277 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the Analysis of the region of the existance of three distinct groups of HCV. HCV genome revealed the existance of three distinct groups of HCV.

Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 3 and type 1 sequences.

The sequences given in AAQ43106-111 show bases 4911-5277 of the NS4 and a consensus sequence. Analysis of this and other regions of the HCV and a consensus sequence. Analysis of three distinct groups of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type I and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type I and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Non-coding region; hepatitis C virus; blood donor; type 2; type 1; HCV; NS-5; phylogeny; differentiation; NS-3; core region; type 3; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAQ43106-111 show bases 4911-5277 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sGluValLeuTyrGlnGlnTyrAspGluMetGluGluCysSerGlnAlaAlaProTyrIl 87
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       being phylogenetically different to type 1 and 2. The same differentiation was noted in the NS-5 (see AAR37923-26) and core between type 3 and type 1 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CysValValIleValGlyHisIleGluLeuGlyGlyLysProAlaIle-ValProAspLy

                                         compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (i) the region spanning positions 417-957 of the Core/El region of HCV subtype 3a; (iii) the region spanning positions 6464-4730 of the NS3 region of HCV type 3; (iii) the region spanning positions 8022-5292 of the NS34 region of HCV type 3; (iii) the region spanning positions 8023-8235 of the NS5 region of HCV type 3; (iv) the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the N33/NS4 region of HCV subtype 3a and is taken from a clone designated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         211
                                                                           Compositions comprising at least 5, and pref. 8 or more contiguous nuclectides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/El region of HCV subtype 3a; (1i) the region spanning positions 4802-5292 of the NS3 region of HCV type 3; (iii) the region spanning positions 8022-8235 of the NS5 region of HCV type 3; (iv) the region spanning positions 8022-8235 of the NS5 region of HCV type 3; (iv) the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic signate belonging to a specific genotype, or as a probe for specific detection/classification of nuclea caid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyphng. This sequence corresponds to the NS3/NS4 month of HCV subtype 3a and is taken from a clone designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TIGCTIGGAGGGGICCTCGCGGCCCTAGGGGCCTACTGCTTGTCAGTCGGCTGCTTGTA 152

                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAQ43106-111 show bases 4911-5277 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 1 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             34
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   81

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            260
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAQ43106-111 show bases 4911-5277 of the NS4 and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ49058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whist the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR7927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       141
